Economic outlook

Issues and Foresight

Economics

The collection “IFPEN Economic Papers” – formerly « *Les Cahiers de l'Économie* », since 1990 – aims to present work carried out at IFP Energies nouvelles and **IFP School** dealing with economics, finance or management of the energy transition.

The Performance of China Green Funds around the COVID-19: A

Comparative Study with Black Funds and Conventional Funds

N° 161 – December 2024 [RESEARCH]

Wang Heda, Arash Farnoosh and Wang Zhen

The analysis covers 102 green funds, 64 black funds, and 434 conventional funds in China, comparing their performance over 93 sample intervals from November 2015 to July 2023. The performance of green and black funds is significantly higher than that of conventional funds over the entire sample period, primarily due to the greater impact of COVID-19 on the industries in which conventional funds invest. Notably, green funds outperform black funds. When dividing the sample period at the onset of COVID-19, it is found that conventional funds generally outperform green and black funds before the pandemic, while green and black funds significantly outperform conventional funds during COVID-19. After COVID-19, as the state promotes economic recovery, conventional funds again outperform green and black funds. Overall, the performance of green funds gradually improves over time, with increased investment in large-cap and growth stocks.

The rise and fall of Neoliberalism: an ecological and regulationist analysis

of France (1960-2022)

N° 160 – June 2024 [RESEARCH]

Alban Pellegris and Victor Court

In this article, we enrich Regulation Theory with metrics from ecological economics: thermodynamic efficiency, exosomatic metabolic rate and the weight of energy expenditure relative to GDP. Then, we use this framework to analyze French capitalism since 1960.

EROI minimum et croissance économique

N° 154 – Mai 2023 [RECHERCHE]

[Victor Court](#), Floriane Fizaine

Après avoir rappelé les concepts d'énergie nette et d'EROI, simples et intuitifs en apparence, nous détaillerons les raisons pour lesquelles l'utilisation de ces notions est difficile en pratique. Nous reviendrons ensuite sur les résultats les plus importants en ce qui concerne le EROI minimum requis pour observer une croissance de l'activité dans une économie moderne. Nous discuterons enfin des notions de croissance, de prospérité et de leurs liens avec l'EROI et la sobriété.

Modeling CO₂ pipeline systems: An analytical lens for CCS regulation

N° 153 – April 2023 [RESEARCH]

Adrien Nicolle, Diego Cedrerros, Olivier Massol, Emma Jagu Schippers

Carbon Capture and Storage (CCS) is regularly depicted as a crucial technology to reduce the social cost of achieving carbon neutrality. However, its deployment critically depends on the installation of CO₂ infrastructures. As the regulatory procedures governing their provision are yet to be clarified, the purpose of this paper is to assess the social and environmental impacts of such regulations. We show how the engineering equations of a CO₂ pipeline implicitly define a Cobb-Douglas production function.

Is Power-to-Gas always beneficial? The implications of ownership

structure

N° 152 – February 2023 [RESEARCH]

Camille Megy, Olivier Massol

Power-to-gas (PtG), a technology that converts electricity into hydrogen, is expected to become a core component of future low-carbon energy systems. While its economics and performance as a sector coupling technique have been well studied in the context of perfectly competitive energy markets, the distortions caused by the presence of large strategic players with a multi-market presence have received little attention. In this paper, we examine them by specifying a partial equilibrium model that provides a stylized representation of the interactions among the natural gas, electricity, and hydrogen markets.

[European Economic impacts of cutting energy imports from Russia: a](#)

[computable general equilibrium analysis](#)

N° 151 – November 2022 [RESEARCH]

Sigit Perdana, Marc Vielle, Maxime Schenckery

The recent economic sanctions against Russia can jeopardize the sustainability of the European Union's (EU) energy supply. Despite the EU's strong commitment to stringent abatement targets, fossil fuels still play a significant role in the EU energy policy. Furthermore, high dependency on Russian energy supplies underlines the vulnerability of the EU energy security. Using a global computable general equilibrium model, we prove that the current EU embargo on coal and oil imported from Russia will have adverse supply effects, substantially increasing energy prices and welfare costs for the EU resident.

Non-linear distance decay effects of clean energy facilities in housing

rental and sale markets: Evidence from hydrogen refueling stations

N° 150 – June 2022 [RESEARCH]

Shuya Wu, Arash Farnoosh, Yingdan Mei

While promoting green and low-carbon transition, clean energy facilities also have externalities, which may lead to opposition and economic losses. There is evidence that the impact of facilities decreases with distance, but existing research make strict assumption on its functional form. In this research work we explore the non-linear relationship between housing transaction prices and distances to the nearest facility without predefined functions combined with spatial smoothing in the hedonic pricing model by taking China as a case-study.

Electricity Distribution Systems in Europe: An Overview of Contemporary

Regulatory Challenges

N° 148 - April 2022 [ANALYSIS]

Pedro H. Perico E Santos, Olivier Massol

In Europe, a significant adaptation of the existing power distribution sector is necessary to support the transition toward low-carbon energy systems and facilitate the massive deployment of low-carbon distributed power technologies. This report first examines the current organization of that industry and highlights the country-specific and diverse nature of the industry structures and the institutional organizations governing the distribution sector.

The impact of Electric Vehicle fleets on the European electricity markets:

evidences from the German passenger car fleet and power generation sector
 N° 146 – January 2022 [RESEARCH]

Maria Juliana Suarez Forero, **Frédéric Lantz**, Pierre Nicolas, Patrice Geoffron

The rapidly increasing participation of renewable energies (REn) into the electric mix, clearly traces the trends for the decarbonization goals in the European Union. Under the priority sale conditions established by governments, the commercialization of REn plays an important role in the consolidation of market prices, which are on a decreasing trend with large fluctuations that reduce the profit in the power sector and therefore, the interest of potential investors.

Cinquième période à venir : les Certificats d'Économies d'Énergie,

catalyseurs du couple Reprise / Transition Ecologique ?

N°141 - March 2021 [STUDY & SYNTHESIS]

Maxime Schenckery, Jacques Millery

Les travaux sur la forme que devra prendre la 5^{ème} période de CEE ont continué, suscitant bien des débats, et aboutissant à une première série de propositions rendue publique début février 2021.

Trajectory Based Robust Optimization Applied to the Case of Electricity

Facilities Investment with Significant Penetration of Renewables

N°140 – February 2021

Pierre Cayet, Arash Farnoosh

As large scale penetration of renewables into electric systems requires increasing flexibility from dispatchable production units, the electricity mix must be designed in order to address brutal variations of residual demand. Inspired from the philosophy of Distributionally Robust Optimization (DRO), we propose a trajectory ambiguity set including residual demand trajectories verifying both support and variability criterion using ambiguous quantile information.

Quantifying virtual water scarcity risk transfers of energy system in China

N°139 – January 2021

Xuebing Yao, Xu Tang, Arash Farnoosh, Cuiyang Feng

Using multi-regional input-output analysis, this study estimates the virtual flows and virtual water scarcity risk transfers driven by interprovincial energy consumption in China. Results could provide reference value for policymakers to develop new energy strategies and manage water resources sustainably.

2020

How are day-ahead prices informative for predicting the next day's

consumption of natural gas?

N°138 – December 2020

Arthur Thomas, Olivier Massol, Benoît Sévi

Using data from France, this paper investigates, for the first time, whether the next day's consumption of natural gas can be accurately forecast using a simple model that solely incorporates the information contained in day-ahead market data.

The Nexus Between Climate Negotiations and Low-Carbon Innovation :A

Geopolitics of Renewable Energy Patents

N° 124 – December 2018

Clément Bonnet, Samuel Carcanague, **Gondia Seck**, Emmanuel Hache, Marine Simoën

Intellectual property is a central issue in the climate negotiations. On the one hand, it shapes and encourages innovation in low-carbon technologies. On the other hand, it reduces access to these technologies by giving patent holders market power. We analyze the interactions between climate negotiations and the acquisition of patents on renewable energy technologies.
